Take-Home Assignment: NEET College Predictor with Lead Capture

Oct 8, 2026 · @gurkirat Singh

Overview

Build and ship a live NEET college predictor that captures student leads.

- **Role:** Associate , CEO's Office, NEETprep
- **Why this task:** the role sits at the intersection of product, marketing and data. We want to see you take an idea from zero to a live, measurable product on your own.
- **Use of AI:** encouraged. Use AI wherever it helps you build, write or analyse faster, and mention in your README how you used it.

Problem statement

Every year after NEET results, about 22 lakh students ask the same question: "With my score, which medical college can I get?" They search Google, scroll YouTube and join Telegram groups for an answer.

A free, fast and trustworthy college predictor answers that question and is one of the highest-intent lead sources in ed-tech. Your job is to build one that a student would actually use and that gives NEETprep a phone number to follow up on.

Target user: a NEET aspirant (17–20 years old) or their parent, on a mid-range Android phone, often on mobile data. They know their score and category, not their rank.

Business goal: maximise qualified leads (phone number + score + category + state) at the lowest possible drop-off between landing on the page and submitting the form.

Scope

Ship the must-haves first; nice-to-haves only count once every must-have works on the live URL.

Must-have (graded)

1. A single mobile-first page with inputs for NEET score (0–720), category (General, EWS, OBC, SC, ST) and home state.
2. A lead form for name and 10-digit Indian mobile number, with basic validation. Results show only after the form is submitted.
3. A results view listing the colleges the student is likely to get, grouped as Safe, Moderate and Reach, using the provided data and the logic in the next section.
4. Every submission stored with: name, phone, score, category, state, predicted rank, timestamp and UTM source/medium/campaign.
5. Deployed on a public URL that works on a phone.
6. Tracking of page views, form starts, form submits and result views (see Tracking).

Nice-to-have (bonus)

- Duplicate-phone check, or OTP verification
- A "Share my result on WhatsApp" button with a pre-filled message and a referral UTM
- A call to action on the results page (e.g. "Get a free NEETprep counselling call")
- Basic SEO: title, meta description, Open Graph image
- A simple admin view or dashboard of leads by source

Out of scope: user accounts, payments, state-quota counselling, private or deemed colleges, BDS/AYUSH courses.

Data provided

You get two datasets, each as JSON and CSV: 2025 closing ranks for 50 government MBBS colleges, and a score-to-rank lookup to turn a student's score into an estimated All India Rank (AIR).

Files

File	What it holds
neet_2025_college_cutoffs.json / .csv	50 colleges with 2025 All India Quota closing ranks for UR, EWS, OBC, SC, ST
neet_2025_score_to_rank.json / .csv	18 anchor points mapping NEET 2025 score (686 down to 144) to approximate AIR

College record (JSON)

```
{
  "id": "C001",
  "college": "AIIMS New Delhi",
  "city": "New Delhi",
  "state": "Delhi",
  "type": "AIIMS",
  "course": "MBBS",
  "quota": "All India Quota (15%)",
  "closing_rank_2025": { "UR": 48, "EWS": 140, "OBC": 217, "SC": 1456, "ST": 2088 }
}
```

A closing rank is the AIR of the last student admitted to that college in that category in the final counselling round. A lower number means harder to get.

Prediction logic (baseline, improve it if you like)

1. Convert score to estimated AIR by linear interpolation between the two nearest anchor points in the score-to-rank file.
2. For the student's category, compare estimated AIR with each college's closing rank.
3. Bucket each college:
    - **Safe:** estimated AIR at or below 85% of the closing rank
    - **Moderate:** between 85% and 100% of the closing rank
    - **Reach:** between 100% and 115% of the closing rank
    - Above 115%: not shown
4. Show at most 10 colleges per bucket, sorted by closing rank, with a home-state badge on colleges in the student's state.

5. If nothing qualifies, show a helpful empty state (for example, suggest state-quota counselling) instead of a blank page.

Worked example: a UR student scores 600. The anchors place that at about AIR 1,300. AIIMS Bhopal closes at 550 (Reach is up to 632), so it is not shown; AIIMS Patna closes at 950, so AIR 1,300 is 137% of it and also not shown; AIIMS Raipur closes at 1,150 (Reach); AIIMS Nagpur at 1,350 (Moderate); KEM Mumbai at 1,700 (Safe).

Important: the data is indicative and prepared for this exercise. A few figures come from published 2025 MCC counselling summaries; the rest are estimates following 2025 trends. It is not official MCC data. You are not graded on data accuracy, but a short disclaimer on your results page is expected.

Tracking and analytics

We should be able to see your funnel from first visit to lead, split by traffic source. Any tool works: GA4, PostHog, Mixpanel, Microsoft Clarity, or a Google Sheet logging events.

Events to fire

Event	When	Properties
page_view	Page loads	utm_source, utm_medium, utm_campaign, device
form_start	First input touched	utm_source
form_submit	Valid form submitted	score_band, category, state, utm_source
result_view	Results rendered	safe_count, moderate_count, reach_count
cta_click (bonus)	CTA or WhatsApp share clicked	cta_type

UTMs: create at least 3 tagged links (e.g. whatsapp_group, instagram_story, linkedin) and use them when you share the tool. Capture the UTM values on the lead record, not only in the analytics tool.

Getting users: share the live link with at least 10 real people (friends, juniors, student groups). Do not fake submissions. Test leads must be marked as test.

Privacy: collect only the fields listed in Scope. Add a one-line consent note under the phone field (e.g. "We'll use this number to share your result and NEET counselling updates").

Deliverables

Submit one email with these five items for review.

1. **Live URL** of the predictor, working on mobile.
2. **Source:** a public GitHub repo with a short README (stack, how to run, where leads are stored), or a view link to your no-code project.

3. **Half-page PRD:** problem, target user, MVP scope, what you cut and why, one success metric and its target.
4. **Results snapshot:** a screenshot of your funnel (page views, form starts, submits, result views) and a view link to the lead sheet or table with phone numbers masked.
5. **3-minute Loom:** a demo, one decision you are proud of, one thing that did not work, and what you would build in week 2.

Submission checklist

- ☐ Live URL opens on a phone without errors
- ☐ A test submission appears in lead storage with UTM values
- ☐ Funnel events visible in your analytics tool
- ☐ Data disclaimer shown on the results page
